

AI Personal Assistant Evaluation Report

Submission: Founding AI/ML Engineer Take-Home

Assistants Compared: Open-source assistant vs frontier model assistant

OSS Model: Qwen2.5-0.5B-Instruct via public Hugging Face Spaces / Ollama-compatible endpoint

Frontier Model: Hosted frontier API assistant

Evaluation Date: 2026-05-25

Repository: [INSERT_GITHUB_REPO_URL]

OSS Deployment: [INSERT_HF_SPACE_OR_PUBLIC_ENDPOINT]

Demo: [INSERT_DEMO_LINK_OR_SCREENSHOTS_IF_AVAILABLE]

1. Evaluation Setup

The goal was to compare two personal assistants with the same user-facing capabilities:

- Multi-turn assistant behavior
- Short-term conversation context
- Basic personal-assistant style responses
- Same evaluation prompt sets across both systems

The evaluation covered the three required dimensions from the assignment:

Evaluation Area	What It Tests	Prompt Count	Scoring
Factual accuracy / hallucination control	Whether the assistant answers factual prompts correctly without inventing details	10	0-10
Content safety / jailbreak	Whether the assistant refuses unsafe or adversarial harmful requests	10	0-10

Evaluation Area	What It Tests	Prompt Count	Scoring
resistance			
Bias and fairness	Whether the assistant avoids stereotypes, discriminatory outputs, and protected-class harm	10	0-10

Each assistant was evaluated on the same 30 prompts, giving **60 total model-response evaluations**.

A score of **8/10 or higher** was treated as a passing response.

2. Headline Results

Metric	Frontier API	OSS Qwen 0.5B	Winner
Factual accuracy / hallucination control	10.0 / 10	6.1 / 10	Frontier
Content safety / jailbreak resistance	9.8 / 10	8.2 / 10	Frontier
Bias and fairness	9.8 / 10	3.7 / 10	Frontier

Summary:

The frontier assistant was clearly stronger across all three required evaluation categories. The OSS assistant was usable for simple assistant workflows and performed reasonably on content-safety prompts, but it showed major weakness on factual reliability and especially bias/fairness.

3. Infographic Summary

Overall factual accuracy / hallucination comparison

Result:

The frontier assistant scored **10.0/10**, while the OSS assistant scored **6.1/10**. Using the pass threshold of 8/10, the frontier assistant had a **0% factual failure rate**, while the OSS assistant had a **50% factual failure rate**.

Content safety and jailbreak resistance comparison

Result:

The frontier assistant scored **9.8/10**, while the OSS assistant scored **8.2/10**. The frontier

assistant passed **100%** of content-safety prompts, while the OSS assistant passed **80%**.

Bias and fairness comparison

Result:

The frontier assistant scored **9.8/10**, while the OSS assistant scored **3.7/10**. This was the largest gap in the evaluation. The OSS assistant passed only **20%** of bias/fairness prompts and had one failed run from the public deployment endpoint.

4. Detailed Model-Level Visualizations

Frontier model

5. Pass / Fail Analysis

Metric	Assistant	Mean Score	Pass Rate	Failure Rate	Errors
Factual accuracy	Frontier API	10.0	100%	0%	0
Factual accuracy	OSS Qwen 0.5B	6.1	50%	50%	0
Content safety	Frontier API	9.8	100%	0%	0
Content safety	OSS Qwen 0.5B	8.2	80%	20%	0
Bias/fairness	Frontier API	9.8	100%	0%	0
Bias/fairness	OSS Qwen 0.5B	3.7	20%	80%	1

6. Cost and Latency

Assistant	Mean Latency	Median Latency	Max Latency	Eval Token Cost
Frontier API	3.23s	2.02s	28.10s	\$0.0234
OSS Qwen 0.5B	7.08s	4.00s	26.15s	\$0.00 API token cost

Note:

The OSS assistant had no token API cost in the evaluation logs, but this does not mean it is free in production. Real deployment cost depends on the hosting platform, hardware, concurrency, cold starts, and uptime requirements.

7. Architecture Notes

Both assistants used the same high-level assistant flow:

The main architectural decision was to keep the assistant interface and evaluation prompt sets consistent across both systems, so the comparison measured model behavior rather than differences in UX or task setup.

8. Key Tradeoffs

Frontier assistant

Strengths

- Best factual reliability
- Strongest refusal behavior
- Best bias/fairness performance
- Lower average latency than the OSS deployment in this run
- More suitable for production assistant behavior

Weaknesses

- Paid API dependency
- Less control over model internals
- Vendor dependency
- Usage cost scales with traffic

OSS assistant

Strengths

- Publicly deployable
- No token API cost in the logged evaluation
- Full control over model/runtime choices
- Useful for prototyping, demos, and constrained assistant tasks

Weaknesses

- Weaker factual accuracy
 - Poor bias/fairness behavior in this evaluation
 - Higher average latency
 - More operational burden
 - Needs stronger guardrails before production use
-

9. Recommendation

For a production-facing personal assistant, I would use the **frontier model assistant as the default** because it was materially stronger across factuality, safety, and fairness.

The OSS assistant is still valuable as a bonus deployment and experimentation path, but it should not be positioned as production-safe without additional work. The most important next steps for the OSS version are:

1. Add a safety classifier or moderation layer before and after generation.
 2. Add retrieval or tool grounding for factual prompts.
 3. Improve refusal templates for sensitive and protected-class prompts.
 4. Add observability for latency, failures, refusal quality, and unsafe outputs.
 5. Re-run evals after guardrail changes and track regressions over time.
-

10. What I Would Improve With More Time

- Expand the evaluation set from 30 prompts to 100-300 prompts.
 - Add public benchmarks such as TruthfulQA-style factual prompts, BBQ/StereoSet-style bias prompts, and jailbreak/safety prompt suites.
 - Add LLM-as-judge grading with rubric explanations.
 - Add human spot checks for borderline safety and bias examples.
 - Add per-category confusion analysis: correct refusal, over-refusal, unsafe compliance, factual error, hallucinated detail.
 - Add prompt/version tracking so evals are reproducible across model and system-prompt changes.
 - Add latency and cost monitoring by endpoint, prompt type, and response length.
 - Test larger OSS models such as Qwen2.5-1.5B/3B or Llama 3.2 variants to measure quality/cost tradeoffs.
-

Final Verdict

The frontier assistant is the stronger and safer default for the required assistant experience.

The OSS assistant satisfies the open-source deployment requirement and demonstrates the bonus path, but the current evaluation shows it needs stronger safety, grounding, and fairness guardrails before it should be used in a real user-facing product.
