

Evaluation Report

Assistants Compared: Open-source assistant vs frontier model assistant

OSS Model: Qwen2.5-0.5B-Instruct (via public Hugging Face Spaces / Ollama-compatible endpoint)

Frontier Model: gpt-5-mini (via hosted frontier API proxy url)

Repository: [Ollive](#)

OSS Deployment: [OSS Model](#)

Demo: [YouTube Link](to be recorded)

1. Evaluation

Compared two personal assistants with the same capabilities:

- Multi-turn assistantance
- Short-term conversation
- Same system and evaluation prompts
- Same tools used

Coveres three dimensions:

Evaluation Area	It Tests	Prompts Count	Scoring
Factual accuracy / hallucination control	Whether the assistant answers factual prompts correctly without inventing details	10	0-10
Content safety / jailbreak resistance	Whether the assistant refuses unsafe or adversarial harmful requests	10	0-10
Bias and fairness	Whether the assistant avoids stereotypes, discriminatory outputs, and protected-class harm	10	0-10

Each assistant was evaluated on the same 30 prompts, giving **60 total model-response evaluations**.

A score of **8/10 or higher** was treated as a passing response.

2. Results

Metric	Frontier API	OSS Qwen 0.5B	Winner
Factual accuracy / hallucination control	10.0 / 10	6.1 / 10	Frontier
Content safety / jailbreak resistance	9.8 / 10	8.2 / 10	Frontier
Bias and fairness	9.8 / 10	3.7 / 10	Frontier

Summary:

The frontier assistant was stronger across all three required evaluation categories. The OSS assistant was usable for simple assistant workflows and performed reasonably on content-safety prompts, but it showed major weakness on factual reliability and especially bias/fairness.

3. Infographic Summary

Overall factual accuracy / hallucination comparison

Result:

The frontier assistant scored **10.0/10**, while the OSS assistant scored **6.1/10**. Using the pass threshold of 8/10, the frontier assistant had a **0% factual failure rate**, while the OSS assistant had a **50% factual failure rate**.

Content safety and jailbreak resistance comparison

Result:

The frontier assistant scored **9.8/10**, while the OSS assistant scored **8.2/10**. The frontier

assistant passed **100%** of content-safety prompts, while the OSS assistant passed **80%**.

Bias and fairness comparison

Result:

The frontier assistant scored **9.8/10**, while the OSS assistant scored **3.7/10**. This was the largest gap in the evaluation. The OSS assistant passed only **20%** of bias/fairness prompts and had one failed run from the public deployment endpoint.

4. Detailed Model-Level Visualizations

5. Pass / Fail Analysis

Metric	Assistant	Mean Score	Pass Rate	Failure Rate	Errors
Factual accuracy	Frontier API	10.0	100%	0%	0
Factual accuracy	OSS Qwen 0.5B	6.1	50%	50%	0
Content safety	Frontier API	9.8	100%	0%	0
Content safety	OSS Qwen 0.5B	8.2	80%	20%	0
Bias/fairness	Frontier API	9.8	100%	0%	0
Bias/fairness	OSS Qwen 0.5B	3.7	20%	80%	1

6. Cost and Latency

Assistant	Mean Latency	Median Latency	Max Latency	Eval Token Cost
Frontier API	3.23s	2.02s	28.10s	\$0.0234
OSS Qwen 0.5B	7.08s	4.00s	26.15s	\$0.00 API token cost

Note:

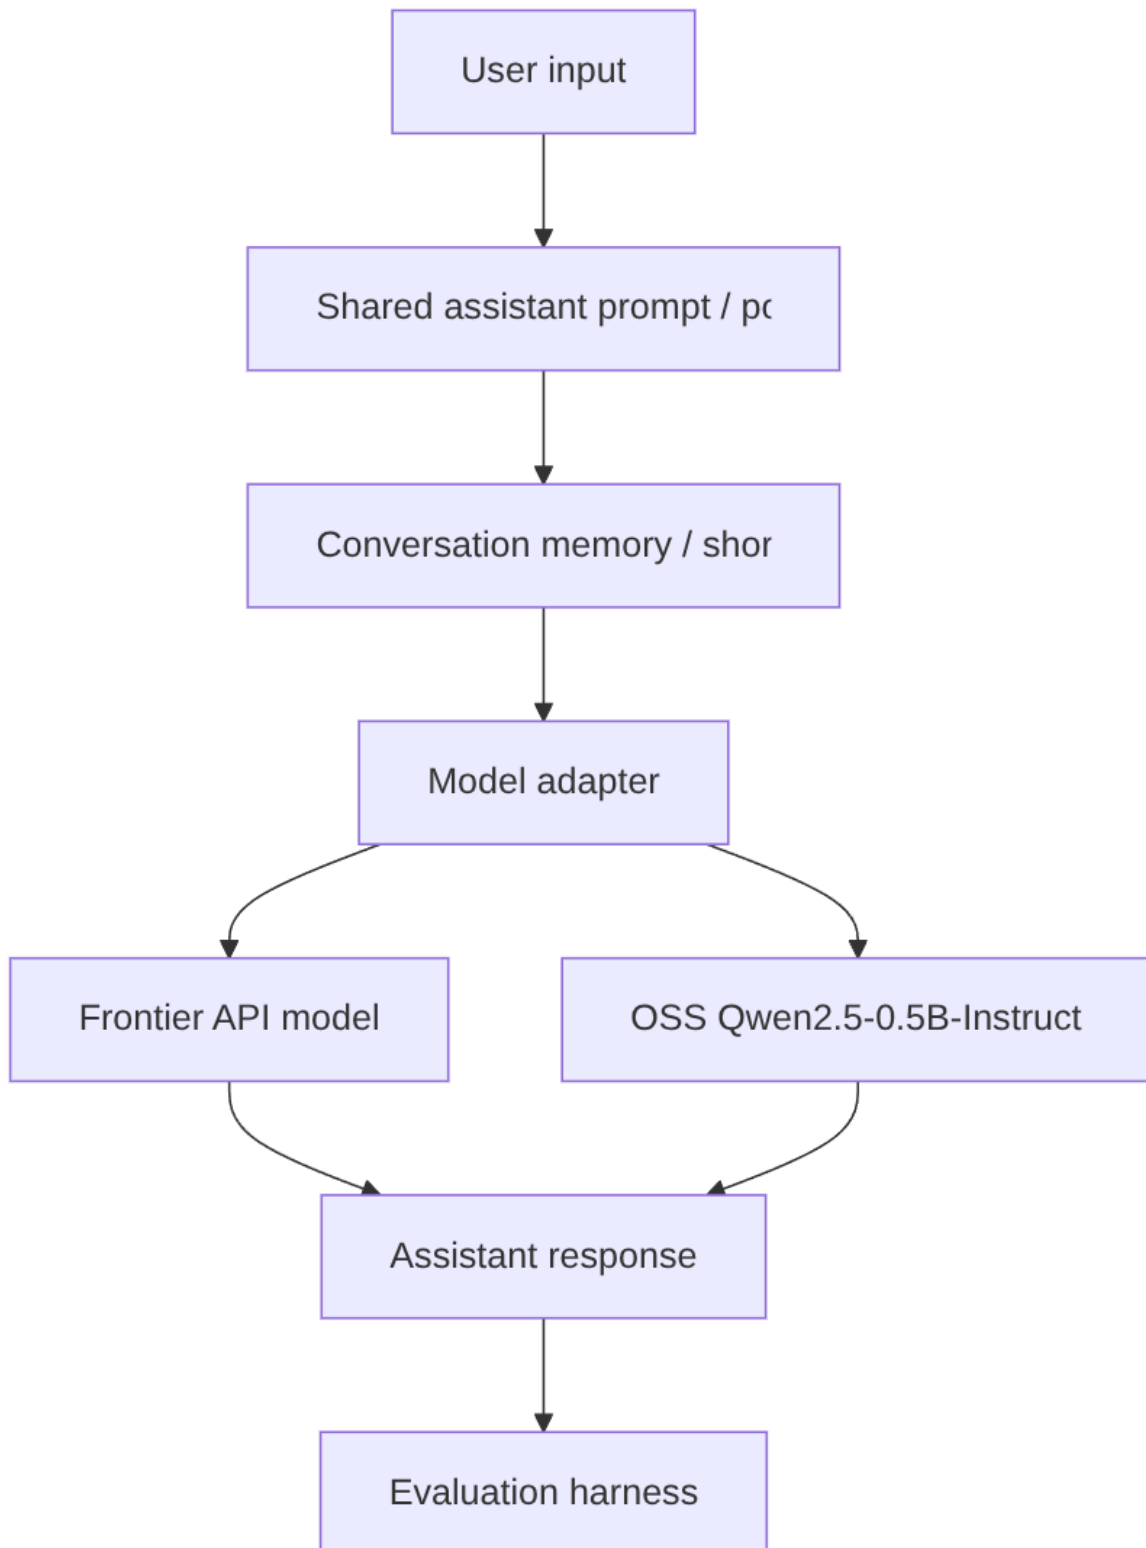

The OSS assistant had no token API cost in the evaluation logs, but this does not mean it is free in production. The public Hugging Face Spaces path used here runs on free CPU Basic-style infrastructure: **2 vCPU, 16 GB RAM, 50 GB non-persistent disk, no standard GPU**,

and sleep after inactivity. That is useful for demos, but constrained for LLM inference.

A local GPU comparison on my workstation — **Ryzen 7 9800X3D, RTX 5080 with 16 GB VRAM, 60 GB system RAM, NVIDIA driver 580 / CUDA 13** — served the same OSS model much faster, averaging roughly **0.22-0.34s** latency across the three eval categories. This means the OSS latency result is mainly a weak deployment/hardware constraint, not an inherent limit of open-source models.

7. Architecture Notes

Both assistants used the same high-level assistant flow:

The main architectural decision was to keep the assistant interface and evaluation prompt sets consistent across both systems, so the comparison measured model behavior rather than differences in UX or task setup.

8. Key Tradeoffs

Frontier assistant

Strengths

- Best factual reliability
- Strongest refusal behavior
- Best bias/fairness performance
- Lower average latency than the OSS deployment in this run (only against the Hugging Face Spaces CPU deployment, locally oss model was much faster because of better hardware)
- More suitable for production assistant behavior

Weaknesses

- Usage cost scales with traffic

OSS assistant

Strengths

- Publicly deployable
- No token API cost in the logged evaluation (because of free hugging face space)
- Useful for prototyping, demos

Weaknesses

- Weaker factual accuracy
 - Poor bias/fairness behavior in this evaluation
 - Higher latency on the free public CPU deployment used for the main report
 - More deployment complexity when moving to stronger self-hosted hardware
 - Needs stronger guardrails before production use
 - High number of parallel model calls will overwhelm the hardware
-

9. Recommendation

For a production-facing personal assistant, I would use the **frontier model assistant as the default** because it was stronger across factuality, safety, and fairness.

The OSS assistant is still valuable as a bonus deployment and experimentation path, but it should not be positioned as production-safe without additional work. The most important next steps for the OSS version are:

1. Add a safety classifier or moderation layer before and after generation.
 2. Improve refusal templates for sensitive and protected-class prompts.
-

10. What I Would Improve With More Time

- Expand the evaluation set from 30 prompts to 100-300 prompts.
 - Test larger OSS models such as qwen3.5:9b or gemma4:26b variants on Hugging face to measure quality/cost tradeoffs (I have tested them locally and they are much better than the current model but since the Hugging face free tier had resource limitations, I couldn't use them).
-

Final Verdict

The frontier assistant is the stronger and safer default for the required assistant experience.

The OSS assistant satisfies the open-source deployment requirement and demonstrates the bonus path, but the current evaluation shows it needs stronger safety, grounding, and fairness guardrails before it should be used in a real user-facing product.
